

Walter van den Bergh (1965) is trained as a neurologist-intensivist at the University Medical Center Utrecht and since 2012 Staff Member at the Department of Critical Care of the University Medical Center Groningen (The Netherlands).

He was involved in several large clinical trials including the MASH-II study (magnesium in SAH) and the HIMALAIA study, which studied the effect of induced hypertension on outcome. Besides caring for critically ill neurological patients he is involved in studies on haematological malignancies, extra-corporeal life support at the intensive care, and subarachnoid hemorrhage.
